

HTTP and Requests

Estimated time needed: **15** minutes

Objectives

After completing this lab you will be able to:

- Understand HTTP
- Handle HTTP Requests

Table of Contents

- Overview of HTTP
 - Uniform Resource Locator:URL
 - Request
 - Response
- Requests in Python
 - Get Request with URL Parameters
 - Post Requests

Overview of HTTP

When you, the **client**, use a web page your browser sends an **HTTP** request to the **server** where the page is hosted. The server tries to find the desired **resource** by default " `index.html` ". If your request is successful, the server will send the object to the client in an **HTTP response**. This includes information like the type of the **resource**, the length of the **resource**, and other information.

The figure below represents the process. The circle on the left represents the client, the circle on the right represents the Web server. The table under the Web server represents a list of resources stored in the web server. In this case an `HTML` file, `png` image, and `txt` file .

The **HTTP** protocol allows you to send and receive information through the web including webpages, images, and other web resources. In this lab, we will provide an overview of the

Requests library for interacting with the HTTP protocol. </p>

The diagram shows a client (labeled 'You/client') and a web server (labeled 'Web Server') connected by two blue vertical bars representing network interfaces. An arrow labeled 'Request' points from the client to the server, and an arrow labeled 'Responses' points from the server back to the client. Below the server, there is a table listing resources:

Resources
Index.html
Image.png
File.txt

Uniform Resource Locator: URL

Uniform resource locator (URL) is the most popular way to find resources on the web. We can break the URL into three parts.

- **scheme** this is the protocol, for this lab it will always be `http://`
- **Internet address or Base URL** this will be used to find the location here are some examples: `www.ibm.com` and `www.gitlab.com`
- **route** location on the web server for example: `/images/IDSNlogo.png`

You may also hear the term Uniform Resource Identifier (URI), URL are actually a subset of URIs. Another popular term is endpoint, this is the URL of an operation provided by a Web server.

Request

The process can be broken into the **request** and **response** process. The request using the `get` method is partially illustrated below. In the start line we have the `GET` method, this is an HTTP method. Also the location of the resource `/index.html` and the HTTP version. The Request header passes additional information with an HTTP request:

Request Message	
Request Start line	Get/index.html HTTP/1.0
Request Header	User-Agent: python-requests/2.21.0 Accept-Encoding: gzip, deflate :

When an HTTP request is made, an HTTP method is sent, this tells the server what action to perform. A list of several HTTP methods is shown below. We will go over more examples later.

localhost:8888/nbconvert/html/pelatihanDS/TugasModul4/PY0101EN-5.3_Requests_HTTP.ipynb?download=false

2/11

HTTP METHODS	Description
GET	Retrieves Data from the server
POST	Submits data to server
PUT	Updates data already on server
DELETE	Deletes data from server

Response

The figure below represents the response; the response start line contains the version number HTTP/1.0 , a status code (200) meaning success, followed by a descriptive phrase (OK). The response header contains useful information. Finally, we have the response body containing the requested file, an HTML document. It should be noted that some requests have headers.

Response Message

Response Start line	HTTP/1.0 200 OK
Response Header	Server: Apache- Cache:UNCACHEABLE
Response Body	<!DOCTYPE html> <html> <body> <h1>My First Heading</h1> <p>My first paragraph.</p> </body> </html>

Some status code examples are shown in the table below, the prefix indicates the class. These are shown in yellow, with actual status codes shown in white. Check out the following [link](#) for more descriptions.

1XX	Informational
2xx	Success
200	OK
3XX	Redirection
300	Multiple Choices
4XX	Client Error
401	Unauthorized
403	Forbidden
404	Not Found

Requests in Python

Requests is a Python Library that allows you to send HTTP/1.1 requests easily. We can import the library as follows:

```
In [1]: import requests
```

We will also use the following libraries:

```
In [2]: import os
        from PIL import Image
        from IPython.display import IFrame
```

You can make a GET request via the method `get` to `www.ibm.com`:

```
In [3]: url='https://www.ibm.com/'
        r=requests.get(url)
```

We have the response object `r`, this has information about the request, like the status of the request. We can view the status code using the attribute `status_code`.

```
In [4]: r.status_code
```

```
Out[4]: 200
```

You can view the request headers:

```
In [5]: print(r.request.headers)

{'User-Agent': 'python-requests/2.25.1', 'Accept-Encoding': 'gzip, deflate', 'Accept': '*/.*', 'Connection': 'keep-alive', 'Cookie': '_abck=B728B206247C8FA15B90738120CA A9CB~-1~YAAQJmAZuB6MRRZ7AQAAAn1V7NwbRFQf5F5jHNn99jLa8Ze0cOuBmUoUuBv2MKjCjnP7fMFqVvD+r
```

```
bP1PnoXFuQqWlgbk1Ec3EK0gZLL8Hj0x4dEdKUqZNa06rVEi2WiIwh9wsZMgVFC45C2Ugg0Ehw3X15glj8Mj
AovZ4+X7ha0NY2Fzcp1S93nRupZFvwwLw2N5I6veyZVzYtmyuF6mfjIHn3wH4PGQWh3wahfErdQ+CXZ5a8S+

Y+Nv4fIXST38jLW412SrSrVql94QJ+tZX+RYnRnv6ma4sIB2aVcJ0tWpMSORWW2mSX3MrJZV+xE1+uro0A+l
LygAhoXS06iyP5dfBjU7pVYmeRBIV855FADFoYBfc00E+6qKKEHfQ0o0VcVqGngkKuiZjbpGnOpHEKZADD4P
kc+acBADB9GajXOdKELap7bgS0mWi3oLdmGcnMbRtLKuixL1/M8DxmN/M=~3621169~4405303'}
```

You can view the request body, in the following line, as there is no body for a get request we get a None :

```
In [6]: print("request body:", r.request.body)
```

```
request body: None
```

You can view the HTTP response header using the attribute `headers` . This returns a python dictionary of HTTP response headers.

```
In [7]: header=r.headers
print(r.headers)
```

```
{'Cache-Control': 'max-age=301', 'Expires': 'Mon, 09 Aug 2021 12:59:46 GMT', 'Last-Modified': 'Fri, 06 Aug 2021 19:54:10 GMT', 'ETag': '"1480b-5c8e9662b64fb"', 'Accept-Ranges': 'bytes', 'Content-Encoding': 'gzip', 'Content-Type': 'text/html', 'X-Akamai-Transformed': '9 16666 0 pmb=mTOE,1', 'Date': 'Wed, 11 Aug 2021 23:10:34 GMT', 'Content-Length': '16732', 'Connection': 'keep-alive', 'Vary': 'Accept-Encoding', 'x-content-type-options': 'nosniff', 'X-XSS-Protection': '1; mode=block', 'Content-Security-Policy': 'upgrade-insecure-requests', 'Strict-Transport-Security': 'max-age=31536000'}
```

We can obtain the date the request was sent using the key `Date`

```
In [8]: header['date']
```

```
Out[8]: 'Wed, 11 Aug 2021 23:10:34 GMT'
```

`Content-Type` indicates the type of data:

```
In [9]: header['Content-Type']
```

```
Out[9]: 'text/html'
```

You can also check the encoding :

```
In [10]: r.encoding
```

```
Out[10]: 'ISO-8859-1'
```

As the `Content-Type` is `text/html` we can use the attribute `text` to display the HTML in the body. We can review the first 100 characters:

```
In [11]: r.text[0:100]
```

```
Out[11]: '<!DOCTYPE html><html lang="en-US"><head><meta name="viewport" content="width=device-width"/><meta ch'
```

You can load other types of data for non-text requests, like images. Consider the URL of the following image:

```
In [12]: # Use single quotation marks for defining string
url='https://gitlab.com/ibm/skills-network/courses/placeholder101/-/raw/master/labs/
```

We can make a get request:

```
In [13]: r=requests.get(url)
```

We can look at the response header:

```
In [14]: print(r.headers)

{'Date': 'Wed, 11 Aug 2021 23:11:06 GMT', 'Content-Type': 'image/png', 'Content-Leng
th': '21590', 'Connection': 'keep-alive', 'Cache-Control': 'max-age=60, public', 'Co
ntent-Disposition': 'inline', 'Etag': 'W/"c26d88d0ca290ba368620273781ea37c"', 'Permi
ssions-Policy': 'interest-cohort=()', 'Vary': 'Accept, Accept-Encoding', 'X-Content-
Type-Options': 'nosniff', 'X-Download-Options': 'noopen', 'X-Frame-Options': 'DENY',
'X-Permitted-Cross-Domain-Policies': 'none', 'X-Request-Id': '01FCVK57HBF6MBMPC20K4A
JFX0', 'X-Runtime': '0.062985', 'X-Ua-Compatible': 'IE=edge', 'X-Xss-Protection':
'1; mode=block', 'Strict-Transport-Security': 'max-age=31536000', 'Referrer-Policy':
'strict-origin-when-cross-origin', 'GitLab-LB': 'fe-05-lb-gprd', 'GitLab-SV': 'web-1
1-sv-gprd', 'CF-Cache-Status': 'REVALIDATED', 'Accept-Ranges': 'bytes', 'Expect-CT':
'max-age=604800, report-uri="https://report-uri.cloudflare.com/cdn-cgi/beacon/expect
-ct"', 'Server': 'cloudflare', 'CF-RAY': '67d52422cd6805b5-IAD'}
```

We can see the 'Content-Type'

```
In [15]: r.headers['Content-Type']
```

```
Out[15]: 'image/png'
```

An image is a response object that contains the image as a [bytes-like object](#). As a result, we must save it using a file object. First, we specify the file path and name

```
In [16]: path=os.path.join(os.getcwd(),'image.png')
path
```

```
Out[16]: '/resources/labs/PY0101EN/image.png'
```

We save the file, in order to access the body of the response we use the attribute `content` then save it using the `open` function and `write` method :

```
In [17]: with open(path,'wb') as f:
          f.write(r.content)
```

We can view the image:

```
In [18]: Image.open(path)
```

```
Out[18]:
```

IBM Developer SKILLS NETWORK

Question 1: write `wget`

In the previous section, we used the `wget` function to retrieve content from the web server as shown below. Write the python code to perform the same task. The code should be the same as the one used to download the image, but the file name should be `'Example1.txt'`.

```
!wget -O /resources/data/Example1.txt https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeveloperSkillsNetwork-PY0101EN-SkillsNetwork/labs/Module%205/data/Example1.txt
```

```
In [19]: url='https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeveloper
path=os.path.join(os.getcwd(),'example1.txt')
r=requests.get(url)
with open(path,'wb') as f:
    f.write(r.content)
```

► [Click here for the solution](#)

Get Request with URL Parameters

You can use the **GET** method to modify the results of your query, for example retrieving data

from an API. We send a **GET** request to the server. Like before we have the **Base URL**, in the **Route** we append `/get`, this indicates we would like to perform a `GET` request. This is demonstrated in the following table:

Base URL	Route
<code>httpbin.org</code>	<code>/get</code>
<code>httpbin.org/get</code>	

The Base URL is for `http://httpbin.org/` is a simple HTTP Request & Response Service. The URL in Python is given by:

```
In [20]: url_get='http://httpbin.org/get'
```

A [query string](#) is a part of a uniform resource locator (URL), this sends other information to the web server. The start of the query is a `?`, followed by a series of parameter and value pairs, as shown in the table below. The first parameter name is `name` and the value is `Joseph`. The second parameter name is `ID` and the Value is `123`. Each pair, parameter, and value is separated by an equals sign, `=`. The series of pairs is separated by the ampersand `&`.

Start of Query	Parameter Name		Value		Parameter Name		Value
<code>?</code>	<code>name</code>	<code>=</code>	<code>Joseph</code>	<code>&</code>	<code>ID</code>	<code>=</code>	<code>123</code>
<code>http://httpbin.org/get?Name=Joseph&ID=123</code>							

To create a Query string, add a dictionary. The keys are the parameter names and the values are the value of the Query string.

```
In [21]: payload={"name":"Joseph","ID":"123"}
```

Then passing the dictionary `payload` to the `params` parameter of the `get()` function:

```
In [22]: r=requests.get(url_get,params=payload)
```

We can print out the URL and see the name and values

```
In [23]: r.url
```

```
Out[23]: 'http://httpbin.org/get?name=Joseph&ID=123'
```

There is no request body

```
In [24]: print("request body:", r.request.body)
```

```
request body: None
```

We can print out the status code

```
In [25]: print(r.status_code)
```

200

We can view the response as text:

```
In [26]: print(r.text)

{
  "args": {
    "ID": "123",
    "name": "Joseph"
  },
  "headers": {
    "Accept": "*/*",
    "Accept-Encoding": "gzip, deflate",
    "Host": "httpbin.org",
    "User-Agent": "python-requests/2.25.1",
    "X-Amzn-Trace-Id": "Root=1-61145953-6ea331a630460e6e3d435a6c"
  },
  "origin": "169.63.179.135",
  "url": "http://httpbin.org/get?name=Joseph&ID=123"
}
```

We can look at the 'Content-Type' .

```
In [27]: r.headers['Content-Type']
```

Out[27]: 'application/json'

As the content 'Content-Type' is in the JSON format we can use the method `json()` , it returns a Python dict :

```
In [28]: r.json()
```

```
Out[28]: {'args': {'ID': '123', 'name': 'Joseph'},
  'headers': {'Accept': '*/*',
  'Accept-Encoding': 'gzip, deflate',
  'Host': 'httpbin.org',
  'User-Agent': 'python-requests/2.25.1',
  'X-Amzn-Trace-Id': 'Root=1-61145953-6ea331a630460e6e3d435a6c'},
  'origin': '169.63.179.135',
  'url': 'http://httpbin.org/get?name=Joseph&ID=123'}
```

The key `args` has the name and values:

```
In [29]: r.json()['args']
```

Out[29]: {'ID': '123', 'name': 'Joseph'}

Post Requests

Like a GET request, a POST is used to send data to a server, but the POST request sends the data in a request body. In order to send the Post Request in Python, in the URL we change the route to POST :

```
In [30]: url_post='http://httpbin.org/post'
```

This endpoint will expect data as a file or as a form. A form is convenient way to configure an HTTP request to send data to a server.

To make a POST request we use the `post()` function, the variable `payload` is passed to the parameter `data` :

```
In [31]: r_post=requests.post(url_post,data=payload)
```

Comparing the URL from the response object of the GET and POST request we see the POST request has no name or value pairs.

```
In [32]: print("POST request URL:",r_post.url )
print("GET request URL:",r.url)
```

```
POST request URL: http://httpbin.org/post
GET request URL: http://httpbin.org/get?name=Joseph&ID=123
```

We can compare the POST and GET request body, we see only the POST request has a body:

```
In [33]: print("POST request body:",r_post.request.body)
print("GET request body:",r.request.body)
```

```
POST request body: name=Joseph&ID=123
GET request body: None
```

We can view the form as well:

```
In [34]: r_post.json()['form']
```

```
Out[34]: {'ID': '123', 'name': 'Joseph'}
```

There is a lot more you can do. Check out [Requests](#) for more.
